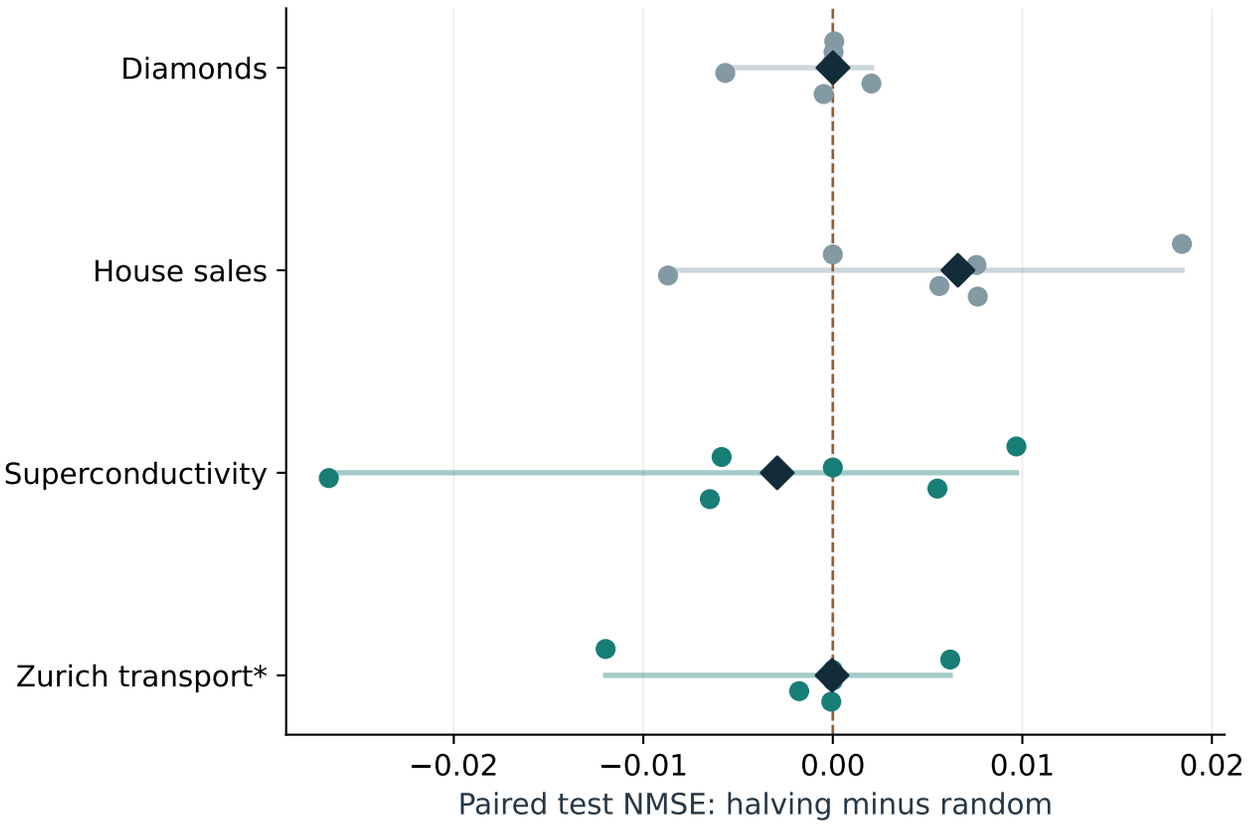
Early screening does not produce a consistent accuracy gain

Two development datasets (grey), two held datasets (teal) | six fixed feature-group split seeds each

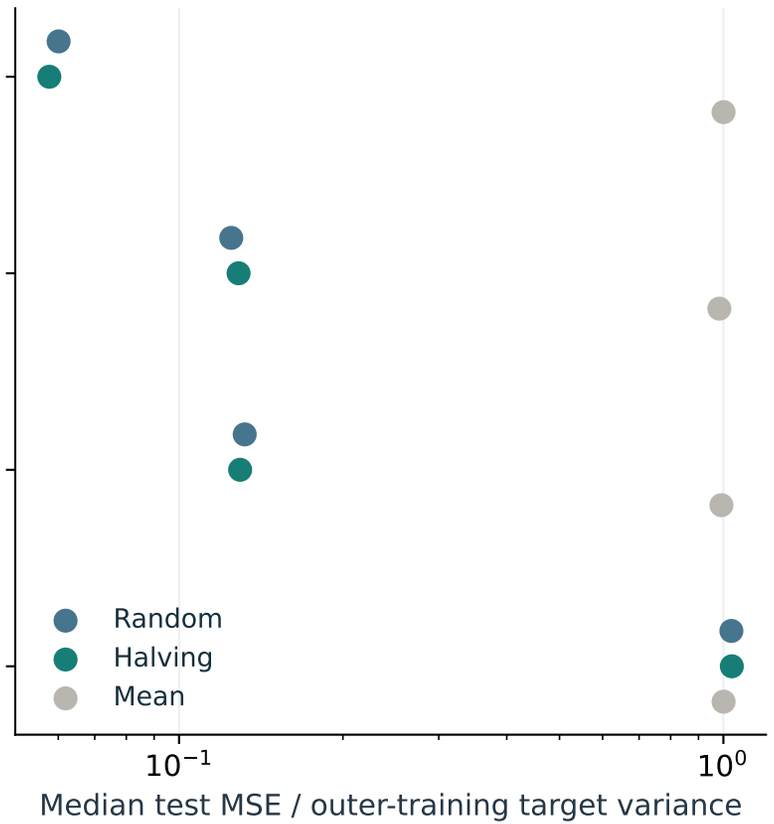
Paired comparison for each split



Negative: halving lower error

Black diamond = paired median; line = observed range

Both searches versus a mean baseline



MEASURED BENCHMARK RESULTS | FIXED PROTOCOL | OVERLAPPING SPLIT SEEDS

* Zurich: 19 predictor groups; only 2-5 groups in each test split. Ranges describe overlapping splits, not confidence intervals.
